- alice: command shell library
- mockturtle: logic network library
- lorina: parsing library
- kitty: truth table library
- bill: reasoning library
- percy: exact synthesis library
- easy: exclusive-or sum-of-product (ESOP) library

¹Mathias Soeken et al. “The EPFL Logic Synthesis Libraries.”. In: *arXiv: Logic in Computer Science* (2022). DOI: null. URL: <https://arxiv.org/abs/1805.05121>.

- angel: quantum state preparation library
- tweedledum: quantum compilation library
- caterpillar: quantum circuit synthesis library

- target:

$$|\varphi_j\rangle = \frac{1}{\sqrt{|\text{on}(f)|}} \sum_{x \in \text{on}(f)} |x\rangle \quad (1)$$

- the general idea of state preparation algorithm relies on the identity:

$$\text{QSP}_f |0\rangle^{\otimes n} = \left(\text{QSP}_{f_{\bar{x}_i}} \oplus \text{QSP}_{f_{x_i}} \right) (G(p_f(\bar{x}_i)) \otimes I_{2^{n-1}}) |0\rangle \quad (2)$$

- $G(p_f(\bar{x}_i))$ is a unitary transformation gate that satisfies:

$$G(p_f(\bar{x}_i))|0\rangle = \sqrt{p_f(\bar{x}_i)}|0\rangle + \sqrt{1 - p_f(\bar{x}_i)}|1\rangle \quad (3)$$

$$G(p_f(\bar{x}_i)) = R_y \left(2 \cos^{-1} \left(\sqrt{p_f(\bar{x}_i)} \right) \right) \quad (4)$$

²Fereshte Mozafari et al. "Automatic Uniform Quantum State Preparation Using Decision Diagrams". In: *2020 IEEE 50th International Symposium on Multiple-Valued Logic (ISMVL) (2020)*. DOI: 10.1109/ismvl49045.2020.00-10.

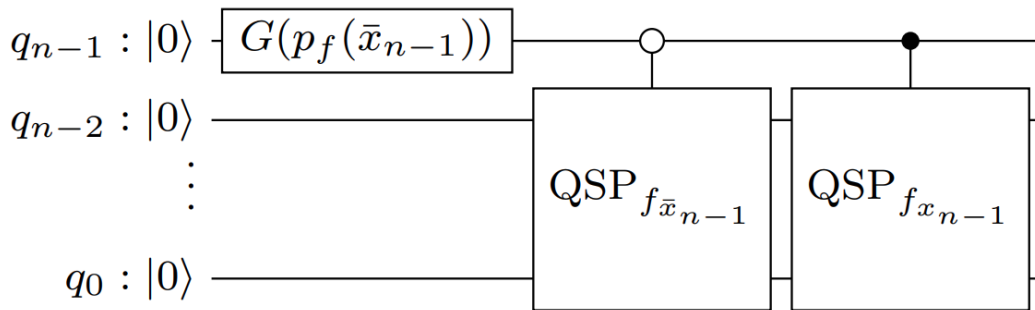

Figure: the general idea of QSP in the quantum circuit model for $i = n - 1$.

initial state example

Figure: the abstract quantum gates of $QSP_{\langle x_0 x_1 x_2 \rangle}$

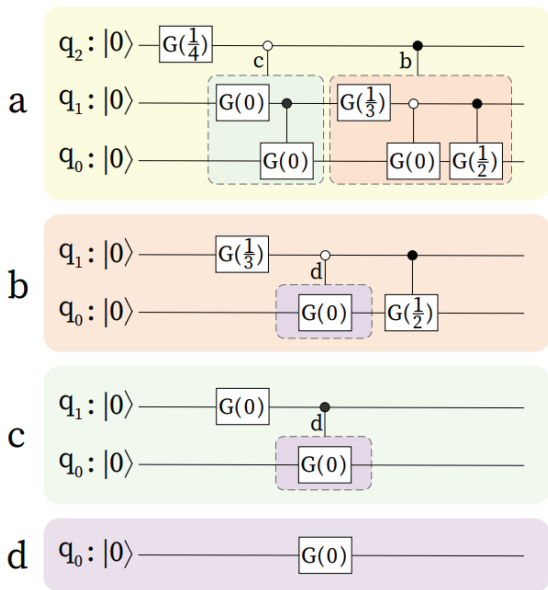

Figure: BDD for boolean function $f = x_0x_1 \vee x_1x_2 \vee x_2x_0$ and the procedure of extracting gates for each node from bottom to top

- representing an n -variable boolean function using a logic network over the gate basis $\{\neg, \oplus, \wedge\}$:

$$x_i = x_{j(i)} \oplus x_{k(i)} \quad \text{or} \quad x_i = x_{j(i)}^{p(i)} \wedge x_{k(i)}^{q(i)} \quad (5)$$

where $n < i \leq n + r$

- the linear transitive fan-in of a node x_i using the recursive function:

$$\text{ltfi}(x_i) = \begin{cases} \{x_i\} & \text{if } i < n \text{ or } o_i = \wedge, \\ \text{ltfi}(x_{j(i)}) \triangle \text{ltfi}(x_{k(i)}) & \text{otherwise} \end{cases} \quad (6)$$

³Giulia Meuli et al. "The Role of Multiplicative Complexity in Compiling Low T-count Oracle Circuits". In: (2019). DOI: 10.1109/iccad45719.2019.8942093.

- for $f(x) = x_1x_2 \vee x_2x_3 \vee x_3x_1$
- can be realized by the logic network:

$$x_4 = x_1 \oplus x_2,$$

$$x_5 = x_2 \oplus x_3 \quad (7)$$

$$x_6 = x_4 \wedge x_5,$$

$$x_7 = x_2 \oplus x_6 \quad (8)$$

- the linear transitive fan-in of a node:

$$\text{ltfi}(x_4) = \{x_1, x_2\},$$

$$\text{ltfi}(x_5) = \{x_2, x_3\} \quad (9)$$

$$\text{ltfi}(x_6) = \{x_6\},$$

$$\text{ltfi}(x_7) = \{x_2, x_6\} \quad (10)$$

function *compute* is

```

for  $i = n + 1, \dots, n + r$  where  $\circ_i = \wedge$  do
  set  $p \leftarrow p(i)$ ,  $q \leftarrow q(i)$ ,  $j \leftarrow j(i)$ ,  $k \leftarrow k(i)$ ;
  set  $L_1 \leftarrow \text{ltfi}(x_j)$ ,  $L_2 \leftarrow \text{ltfi}(x_k)$ ;
  if  $L_1 \subseteq L_2$  then
    swap  $L_1 \leftrightarrow L_2$  and  $p \leftrightarrow q$ ;
  end
  let  $t_1$  be some element in  $L_1 \setminus L_2$ ;
  let  $t_2$  be some element in  $L_2$ ;
  CNOT( $x, t_1$ ) for all  $x \in L_1 \setminus \{t_1\}$ ;
  CNOT( $x, t_2$ ) for all  $x \in L_2 \setminus \{t_2\}$ ;
  if  $p$  then NOT( $t_1$ );
  if  $q$  then NOT( $t_2$ );
  TOFFOLI( $t_1, t_2, x_i$ );
  if  $p$  then NOT( $t_2$ );
  if  $q$  then NOT( $t_1$ );
  CNOT( $x, t_2$ ) for all  $x \in L_2 \setminus \{t_2\}$ ;
  CNOT( $x, t_1$ ) for all  $x \in L_1 \setminus \{t_1\}$ ;
end
end

```

Figure: quantum circuit construction for function compute

Algorithm 1 Heuristic compilation algorithm

Input: Logic network with gates x_{n+1}, \dots, x_{n+r}

Output: Quantum circuit for Uf

```

compute
CNOT( $x_{n+r-1}, y$ )
if  $p$  then
  NOT( $y$ )
end if
compute†

```

- target: solving iteratively the reversible pebbling game on the given network
- method: the problem is encoded as a SAT problem and addressed by state-of-the-art solvers
- result: get the trade-off between qubits and operations

⁴Giulia Meuli et al. “Reversible Pebbling Game for Quantum Memory Management”. In: *arXiv: Quantum Physics* (2019). DOI: 10.23919/date.2019.8715092.

pebbling example

Figure: example of a directed acyclic graph

Figure: space-optimized by reordering

Figure: Bennet strategy

Figure: space-optimized by increasing the number of gates

- narrowing the gap between high-level algorithms and physical devices
- an intuitive and flexible intermediate representation that supports different abstraction levels across the same circuit structure

⁵Bruno Schmitt and Giovanni De Micheli. “Tweedledum: A Compiler Companion for Quantum Computing”. In: *2022 Design, Automation Test in Europe Conference Exhibition (DATE)* (2022). DOI: 10.23919/date54114.2022.9774510.

compilation flow

Figure: compilation flow overview

Figure: tweedledum's IR flexibility

- `pkrm_synth` and `pprm_synth` synthesize a particular case of an exclusive-or sum-of-product (ESOP) expression for `f`
- `spectrum_synth` uses the Rademacher-Walsh spectrum of a truth table to generate a circuit
- `lhrs_synth` and `xag_synth` are examples of hierarchical synthesis
- `a_star_swap_synth` and `star_swap_synth` for circuits composed entirely of SWAP operators

Figure: overview of possible Boolean function synthesis flows

- utility
- decomposition
- mapping
- optimization

Figure: Zed city as an undirected graph

initial state boolean function

python implementation of initial function f

```
def g(v0, ..., v6 : BitVec(2)) -> BitVec(1):  
    return (v0 != "00) and (v1 != "01) and (v2 != "00) and (v2 != "10) and (v3 !=  
            "00) and (v4 != "01) and (v5 != "11) and (v6 != "11)
```

boolean function

python implementation of f

```
def f(v0, ..., v6 : BitVec(2)) ->
    BitVec(1):
    c0 = (v0 != "00")
    c1 = (v1 != "01") and (v1 != v0)
    c2 = (v2 != "00") and (v2 != "10")
        and (v2 != v0)
    c3 = (v3 != "00") and (v3 != v0)
        and (v3 != v1) and (v3 != v2)
    c4 = (v4 != "01") and (v4 != v1)
        and (v4 != v3)
    c5 = (v5 != "11") and (v5 != v2)
        and (v5 != v3)
    c6 = (v6 != "11") and (v6 != v2)
        and (v6 != v3) and (v6 != v4)
        and (v6 != v5)
    return c0 and c1 and c2 and c3
        and c4 and c5 and c6
```

hand-optimized python implementation of f

```
def f(v0, ..., v6 : BitVec(2)) ->
    BitVec(1):
    c1 = (v1[0] == v1[1]) and (v3 !=
        v1)
    c023 = ((v0 ^ v2 ^ v3) == "00")
    c4 = (v4 != v1) and (v4 != v3)
    c5 = (v5 != v2) and (v5 != v3)
    c6 = ((v2 ^ v3 ^ v5 ^ v6) == "00")
        and (v6 != v4)
    return c1 and c023 and c4 and c5
        and c6
```

	Hand-optimized		Non-optimized	
	Qubits	cost	Qubits	cost
IBM's solution	32	5004		
Whit3z solution	32	2474		
XAG-based flow	31	2202	56	4347
XAG-based flow with pebbling	21	4497	30	7737

Table: quality of results for boolean function (hand-optimized and non-optimized), where $cost = q_1 + 10q_2$
